Digital Literacy Final Project Report

Student Name: Piyush Gupta

Registration Number: [25BCY10257]

Date: March 2026

1. Introduction

This report summarizes the tasks completed for the Digital Literacy module. The project aims to demonstrate proficiency in various digital domains, including professional presentation, online identity management, technical platform usage, professional communication, and cyber-safety.

2. Task Summaries

Task 1: Professional Presentation

Created a digital presentation using Canva focusing on the core pillars of digital literacy. The presentation emphasizes the importance of finding, evaluating, and sharing information effectively in a digital-first world.

Task 2: Professional Portfolio

Established a professional online presence by setting up and optimizing LinkedIn and GitHub profiles. This task focused on personal branding and making a positive first impression on potential employers.

Task 3: Digital Platforms

Demonstrated technical skill by earning a problem-solving badge on HackerRank and showcasing data management skills using Google Workspace (Forms and Sheets).

3. Reflection Report (Task 4: Digital Etiquette)

Topic: The Impact of Poor Digital Communication

A common situation where poor digital communication causes significant problems is the "Reply All" mistake in a professional office. For instance, an employee might accidentally send a private disagreement or a sensitive question about their salary to an entire company listserv instead of just their manager. This error leads to a major privacy breach, clutters dozens of inboxes, and causes immediate professional embarrassment.

To avoid this, the sender should have double-checked the "To" and "Cc" fields before clicking send. Furthermore, using a clear subject line and a formal greeting helps set a professional tone that encourages the sender to be more mindful. In digital spaces, "thinking before clicking" is the most effective strategy to maintain a positive online reputation.

4. Cybercrime Case Study (Task 5: Online Safety)

Case Study: UPI Payment Fraud

Nature of Crime: UPI fraud involves tricking victims into authorizing payments via QR codes or "Request Money" links under the guise of receiving funds.

Mechanism: Attackers often pose as buyers on marketplaces. They send a QR code to the victim, claiming it is for "payment verification." When the victim scans the code and enters their UPI PIN, money is instantly debited from their account rather than credited.

Prevention: * Never enter a UPI PIN to receive money.

Verify the identity of individuals before clicking any payment links.

Use the National Cybercrime Helpline (1930) or portal (cybercrime.gov.in) to report incidents immediately.

5. Conclusion

Through this project, I have developed a well-rounded understanding of digital literacy. I have moved from basic tool usage to understanding the ethical and safety implications of living in a digital society. These skills are essential for my future academic and professional career.
